An issue has been identified in the simulated samples used to calculate the track reconstruction efficiencies, which affects the published  $J/\psi$  production cross-section in  $pp$  collisions at  $\sqrt{s} = 13$  TeV [1]. A brief description of the nature of the problem is provided and then the corrected results are given.

The charge collected in the LHCb VELO sensors is affected by radiation damage. One such effect, which is more pronounced in the outer regions of downstream sensors, arises from charge induction on second metal layer routing lines [2]. Prior to the start of Run 2, modifications were made to the digitization step in the LHCb simulation framework to model this effect. An error was made in the parametric implementation resulting in a reduction of the track reconstruction efficiency in simulation compared to data for tracks with low pseudorapidity. The tracking efficiency calibration procedure that was applied in this paper to the data and simulation [3] was unable to correct the mismodelling.

The results presented in the paper are affected, especially those at low rapidities, while the effect is marginal at high rapidities. Updated tracking calibrations have been implemented for this analysis, resulting in a change of the tracking efficiency and higher systematic uncertainties. Having resolved the issue, the corrected production cross-sections are  $15.03 \pm 0.03 \pm 0.94 \mu\text{b}$  for prompt  $J/\psi$  and  $2.25 \pm 0.01 \pm 0.14 \mu\text{b}$  for  $J/\psi$  from  $b$ -hadron decays, integrated over the kinematic coverage  $p_T < 14 \text{ GeV}/c$  and  $2.0 < y < 4.5$ . The updated total  $b\bar{b}$  production cross-section in  $4\pi$  is found to be  $\sigma(pp \rightarrow b\bar{b}X) = 495 \pm 2 \pm 52 \mu\text{b}$ . The NRQCD [4] prediction agrees remarkably well with the experimental data for the prompt  $J/\psi$  production cross-section ratio, while the FONLL [5] prediction also provides a reasonably good agreement with our measurements for the  $J/\psi$ -from- $b$  cross-section ratio.

All tables and figures with affected measurements are corrected and are given below, with the numbering and captions being identical to those in the original paper.

Source	Systematic uncertainty (%)
Luminosity	3.9
Hardware trigger	0.1 – 5.9
Software trigger	1.5
Muon ID	1.8
Tracking	1.9 – 8.2
Radiative tail	1.0
$J/\psi$ vertex fit	0.4
Signal mass shape	1.0
$\mathcal{B}(J/\psi \rightarrow \mu^+\mu^-)$	0.6
$p_T, y$ spectrum	0.1 – 6.5
Simulation statistics	0.5 – 10.0
$t_z$ fit ( $J/\psi$ -from- $b$ only)	0.1

**Table 1.** Relative systematic uncertainties (in %) on the  $J/\psi$  cross-section measurements. The uncertainty from the  $t_z$  fit only affects  $J/\psi$ -from- $b$  mesons. Most of the uncertainties are fully correlated between bins, with the exception of the  $p_T, y$  spectrum dependence and the simulation statistics, which are considered uncorrelated.
